1.0 STORMWATER AND DRAINAGE NARRATIVE

This Stormwater Analysis and Drainage Report provides a summary of the stormwater management system for the proposed Southern Tier Affordable Housing Development project located at 85 Edgartown-Vineyard Haven Road in Oak Bluffs, Massachusetts. The purpose of this report is to describe the pre- and post-development site conditions and the practices to be used for reducing stormwater discharges and pollutants during and after construction. The proposed project has been developed to incorporate a series of stormwater infiltration and green stormwater infrastructure (GSI) practices into the overall site and landscape design. The design includes natural practices such as vegetated bioretention areas and swales, as well as a water quality unit to provide filtration and underground chambers to store and infiltrate runoff generated within the development area.

The parcel is currently undeveloped woodland, the majority of which is within a Zone II Wellhead Protection Area and a Natural Heritage Priority Habitat area. The project design follows the guidelines established in the Martha's Vineyard Commission (MVC) Water Quality Management Policy, MVC Site Design and Landscape Policy, and the Coastal Stormwater Management Through Green Infrastructure Handbook produced by the EPA. The proposed project is not subject to the requirements of the Massachusetts Stormwater Handbook (revised in January 2008), including the ten associated Stormwater Standards; however, the project was designed in compliance with these requirements to the maximum extent practicable.

The overall goal of the proposed stormwater management design is to mimic the existing hydrologic properties of the site through the use of thoughtful grading, natural swales, GSI practices and underground recharge chambers, to ensure that all applicable water quality and groundwater recharge standards are met and that peak rates of runoff are attenuated during the range of design storms. Refer to Section 2.0 – Drainage Design Methodology and Analysis and Section 3.0 – Analysis of Massachusetts Stormwater Standards for detailed information about the proposed design. The proposed stormwater controls will be maintained appropriately during regular operation of the site, per the Operation and Maintenance Plan (Appendix H), as well as during construction as indicated on the Drawings.

1.1 Existing Conditions

The proposed project site is undeveloped with no identified environmental contamination or hydrologic concerns. The site, designated as Lot 31 of tax assessor map 50, is a 7.78-acre parcel located on the north side of Edgartown Vineyard Haven Road, directly east of the existing ice arena and YMCA of Martha's Vineyard property. Martha's Vineyard High School is located across Edgartown Vineyard Haven Road. The northern properly boundary abuts undeveloped lands held by the Martha's Vineyard Land Bank Commission, known as Southern Woodlands Reservation. The project site is currently covered in coastal woodlands. Except for the southerly portion, the entire project site is mapped as Priority Habitat (PH 121) for the State-Threatened Species, Imperial Moth (*Eacles imperialis*). The majority of the project site also falls within a Zone II Wellhead Protection Area, with the exception of the southeast corner.

The topography of the project site varies between 111 feet at the high point of the existing forested knoll to 87 feet in the southeast corner. The site generally drains in all directions from the peak of the existing forested knoll, as depicted on the Existing Conditions Plan (Sheet C-3) and the Drainage Area Maps (Appendix B).

1.1.1 Soils

Based on a desktop study performed using the United States Department of Agriculture Natural Resource Conservation Service (USDA NRCS) Web Soil Survey, the project site soils are comprised predominantly of Riverhead sandy loam (288B), with a smaller area of Carver loamy coarse sand (259A) in the northeast corner of the site. Both are well-drained soils formed in glacial outwash or glaciofluvial environments, and both are characterized under NRCS Hydrologic Soil Group A.

On site soil testing was conducted by Schofield, Barbini & Hoehn Inc. on September 28, 2020 in the northern portion of the site, and on August 27, 2021 in the southern portion. These two days of soil testing cover most of the project site, and generally confirms the soil types found in the Web Soil Survey desktop study. The topsoil and subsoil horizons were classified as loamy sand and sandy loam. With the exception of the test hole located at a higher elevation along the forested knoll (Test Hole 3), a relatively low-permeability soil layer was encountered starting at roughly 24 inches deep and extending to approximately 60 inches below the ground surface. This soil layer was classified as a Sandy Loam to Silt Loam, which is indicative of the glaciofluvial depositional environment identified in the published soil maps. Beneath this soil layer and consistent with the soil maps, a sand and gravel outwash material was encountered to depths ranging from 10 to 11 feet. No indication of seasonal high groundwater was observed in any of the test holes.

Percolation tests conducted within the sandy outwash material yielded results ranging from 2 to 5 minutes per inch, depending on location. Conservatively, the Rawl's Rate of the native sandy soil (8.27 inches per hour) was used for design of the Underground Recharge Chambers. For the design of the proposed bioretention areas, a rate of 2.41 inches per hour (Loamy Sand) was selected to account for the bioretention soil. The background soils information for the project site can be found in **Appendix A** of this report.

Table 1: Rawls Infiltration Rates

Texture Class	NRCS Hydrologic Soil Group (HSG)	Infiltration Rate Inches/Hour
Sand	Α	8.27
Loamy Sand	Α	2.41
Sandy Loam	В	1.02
Loam	В	0.52
Silt Loam	С	0.27
Sandy Clay Loam	С	0.17
Clay Loam	D	0.09
Silty Clay Loam	D	0.06
Sandy Clay	D	0.05
Silty Clay	D	0.04
Clay	D	0.02

Source: Rawls, Brakensiek and Saxton, 1982.

1.1.2 Stormwater Management

There is no existing stormwater management on site. Due to the underlying soils and undeveloped condition of the site, very little stormwater runoff is generated. The ridge in the middle of the site creates runoff discharge in all directions, including to the Edgartown-Vineyard Haven Road.

1.1.3 Drainage Area

The existing drainage area is 7.62 acres (331,850 sf) with the following land cover:

Table 2: Existing Land Coverage

Coverage	Area (sq ft)	Area (acres)	%
Paved	1,700	0.039	0.5%
Gravel	2,140	0.049	0.6%
Roof	0	0.000	0%
Water	0	0.000	0%
Woods	328,010	7.530	98.9%
Grass	0	0.000	0%
TOTAL	331,850	7.618	100%

The site generally drains from the knoll in the northeast of the site in all directions. The drainage area map for existing conditions is provided in **Appendix B**.

1.1.4 Priority Habitat of Rare Species

According to the most recent version of the *Massachusetts Natural Heritage Atlas* (15th Edition, August 1, 2021), the project site occurs within *Priority Habitat of Rare Species* (PH 121) as designated by the Massachusetts Natural Heritage and Endangered Species Program (NHESP). In response to a MESA Information Request, NHESP has indicated that this

designation is due to the presence of the state-threatened, Imperial Moth (*Eacles imperialis*) According to the NHESP Fact Sheet, primary habitat for this species includes pitch pine (*Pinus rigida*), and the priority habitat mapping appears to follow the dense areas of concentrated pitch pine growth. The MESA Project Review narrative prepared by Horsley Witten Group in September 2022 is included in **Appendix G**.

1.2 Proposed Conditions

The Applicant proposes to construct the following:

- Ten multi-family buildings containing 85 total bedrooms, as follows:
 - o Buildings 1-4 & 6: Six two-bedroom units
 - Buildings 5 & 7-10: Two 1-Bedroom and one 3-bedroom units (3 units)
- One central community building (Building 11), and common green space;
- All roof areas equipped with gutters and downspouts to convey stormwater runoff directly to underground recharge systems via drain pipes;
- Approximately 1,450 linear feet of paved access driveways with attached paved or gravel parking lots (68 total spaces in Phase I, with an additional 22 future spaces planned for Phase II. including ADA accessible spaces;
- ADA accessible sidewalks, comprised primarily of stabilized stone dust with select areas of cement concrete;
- Landscaped areas, open spaces, and solar-powered lighting;
- Underground electric/communication and public water utility infrastructure;
- Centralized on-site sanitary wastewater disposal system comprised of a community septic tank, KleanTu NitROE advanced treatment system and Presby Enviro-Septic gravity leachfield;
- Utility extensions and stubs for potential future development project by the Town of Oak Bluffs, including water, underground electric/communication, and sanitary sewer;

The proposed development envelope is limited to approximately 4.81 acres of the 7.78-acre property (4.49 acres for Phase I only). A future roadway corridor (0.7 acres) is proposed along the easterly property line, which would provide access to the potential Oak Bluffs development project to the north. In addition to the large protected open space area proposed in the north of the property, natural oak-pine woodland corridors will be preserved to the extent possible along Edgartown-Vineyard Haven Road as well as the westerly property line toward the YMCA property. The proposed Phase II parking spaces are located along the westerly property line, which would reduce the width of woodland buffer in the event that Phase II is constructed in the future.

Due to the subject property's designation as Priority Habitat for the Imperial Moth, the proposed development envelope was selected based upon close coordination with the Natural Heritage & Endangered Species Program (NHESP) of the MA Division of Fisheries & Wildlife. The proposed project will permanently protect 1.87 acres in the northerly portion of the property, which is comprised of a mixed oak-pine forest surrounding a natural knoll. The final design is based upon the Applicant's desire to protect as much existing land as possible in accordance with MVC's Open Space Preservation Policy, while still creating a pedestrian-oriented affordable housing community that fits within the unique character of Martha's Vineyard. As documented in a letter dated October 20, 2022, the MA Division of Fisheries & Wildlife has determined that the proposed development will not "result in a Take of state-listed species", subject to a set of project conditions (see letter in Appendix G).

1.2.1 Stormwater Management

The proposed stormwater management includes a GSI approach to capture, treat, infiltrate, and detain runoff, when applicable and to the maximum extent practicable, by using the following BMPs.

Bioretention Areas (BIO AREA)

A bioretention area (also referred to as a "rain garden" or a "biofilter") is a stormwater management practice used to treat stormwater runoff using a conditioned planting soil bed or "filter" media and plants to filter runoff captured in a shallow depression. The method combines physical filtering and adsorption with bio-geochemical processes to remove pollutants. The system consists of an inflow component, a pretreatment element, an overflow structure, and shallow ponding area.

Underground Recharge Chambers (URC)

Underground recharge chambers are intended to store and infiltrate stormwater collected from surrounding drainage areas. The proposed bioretention areas are equipped with grated drain inlets to direct surface stormwater to the subsurface recharge systems. Treated stormwater is infiltrated directly into the ground, mimicking pre-development conditions. Use of stormwater recharge chambers provides an effective and low-maintenance means of storing excess stormwater, allowing it to infiltrate and recharge groundwater.

Rain Guardian Inlets

Rain Guardian "Fortress" pretreatment structures are proposed as the inlet to the majority of stormwater bioretention areas, which are designed to filter sediment from the incoming stormwater runoff using a screen system. Due to the lack of a sump for sediment storage, these structures require more frequent cleaning as described in the Stormwater Operation and Maintenance Plan.

Sediment Forebay

A sediment forebay is also provided for pretreatment of the surface water runoff from the proposed pavement surfaces in the southern portion of the development, to allow sediment to

settle from the incoming stormwater runoff prior to conveyance to the adjacent bioretention area.

Water Quality Unit

Water Quality Units are proprietary pretreatment devices designed to filter out sediment and debris by reducing velocity and directing flow during a series of chambers. Debris and sediment accumulate within the structure before the flow is directed to an infiltration practice, like underground recharge chambers.

1.2.2 Drainage Area

The proposed drainage area is 7.62 acres (331,850 sf) with the following land cover:

Table 3: Proposed Land Coverage

Coverage	Area (sq ft)	Area (acres)	%
Paved	65,090	1.494	19.6%
Gravel	0	0.000	0.0%
Roof	23,820	0.547	7.2%
Water	5,110	0.117	1.5%
Woods	120,570	2.768	36.3%
Grass	117,260	2.692	35.3%
TOTAL	331,850	7.618	100%

The proposed site drainage is divided into 19 subcatchments. DA1A-1F ultimately drain to SP1, DA2A-2C to SP2, DA3A-3E to SP3, DA4A-4D to SP4 and drainage area DA5 remains unchanged and drains to SP5. Pre- and Post-Development Drainage maps can be found in **Appendix B** and the routing of all drainage areas can be found in the HydroCAD modeling in **Appendix D**.

2.0 DRAINAGE DESIGN METHODOLOGY AND ANALYSIS

The drainage design was completed by performing the following series of tasks:

- Site soil evaluation. See Section 1.1.1 and Appendix A for the description of soils and infiltration rates based on NRCS data and results from the on-site soils investigations conducted by Schofield, Barbini & Hoehn Inc. on September 28, 2020 and August 27, 2021.
- Delineation of existing and proposed drainage areas (Appendix B)
- Sizing the bioretention areas (Appendix C)
- Modeling the proposed drainage and infiltration system with HydroCAD® software (Appendix D)
- Recharge Calculations (Appendix E)
- Pollutant Removal Calculations (Appendix F)
- Operations and Maintenance Manual (Appendix H)

The proposed stormwater management system has been designed in accordance with MVC guidelines and the Massachusetts Stormwater Handbook to the maximum extent practicable, to accomplish the following major objectives:

- To capture and treat, the "first flush" water quality volume (WQV, the first one-inch of stormwater runoff) from the impervious surfaces to provide water quality treatment for the proposed development. Treatment is achieved with a combination of aboveground treatment practices and underground recharge chambers.
- To provide groundwater recharge in conformance with the Massachusetts Department of Environmental Protection groundwater recharge criteria.
- To evaluate runoff discharging off-site from the post-development conditions at the study points located along the site periphery to ensure no flooding or erosion will occur.

These objectives are met using the following stormwater management measures:

- GSI practices, as described in Section 1.2.1, sized to provide water quality treatment for the roads, walkways, and parking area runoff. Each practice is designed with overflow structures to convey runoff from larger storm events into proposed underground recharge chambers.
- Underground recharge chambers sized to retain and infiltrate onsite runoff to the maximum extent practicable. Storage is provided for stormwater management to maintain or reduce predevelopment rates of runoff.

The proposed stormwater management system was designed to accommodate predevelopment site hydrologic conditions as well reduce stormwater pollution from the proposed site conditions. Stormwater runoff rate and volume was evaluated for the WQV, 2-year, 10-year, 25-year and 100-year Type III, 24-hour storm events for both pre-development and post-development conditions. Per MVC requirements, the stormwater management system was sized to treat the one-inch of runoff from the site, prevent erosive conditions during the 10-year storm event, and designed to detain runoff from the 25-year storm event. In addition, the peak discharge impact from the 100-year storm was also evaluated to ensure no offsite flooding or erosion occurs.

Pre- and post-development conditions were modeled using HydroCAD software, which combines USDA Soil Conservation Service hydrology and hydraulic techniques (commonly known as SCS TR-55 and TR-20) to generate hydrographs (See **Appendix B** for both "Predevelopment" and "Post-development" Drainage Area Maps). Rainfall amounts for the specified storm recurrence intervals are based on the 90th percentile precipitation estimates from the National Oceanic and Atmospheric Administration (NOAA) Atlas 14 Point Precipitation Frequency Estimates for the area (accessed September 2022).

Table 4: Peak Flow and Volume Comparison

SP1	ROAD					
F a.m.t	Pre-development		ppment Post-development		Change	
Event	Flow, cfs	Volume, a-f	Flow, cfs	Volume, a-f	Flow, cfs	Volume, a-f
2-yr	0.11	0.012	0.27	0.021	0.16	0.009
10-yr	0.16	0.021	0.40	0.038	0.24	0.017
25-yr	0.19	0.040	0.49	0.050	0.30	0.010
100-yr	0.40	0.088	4.84	0.498	4.44	0.410

*Note: The post-development flow rate in the 100-year storm is distributed across the site's frontage, thereby minimizing the rate at any single location and preventing erosion or offsite flooding. A controlled, low velocity outlet is incorporated for the URC system overflow during this storm event. The URC system is sized to completely retain and infiltrate runoff from the 25-year storm event.

SP2	SOUTHEAST					
	Pre-development		Post-development		Change	
Event	Flow, cfs	Volume, a-f	Flow, cfs	Volume, a-f	Flow	Volume
2-yr	0.00	0.000	0.02	0.002	0.02	0.002
10-yr	0.02	0.015	0.03	0.020	0.01	0.005
25-yr	0.13	0.051	0.18	0.055	0.05	0.004
100-yr	0.79	0.145	0.83	0.142	0.04	-0.003

*Note: The minor increases in the proposed condition are considered negligible, and are generally a result of the change in pervious ground cover from woods to grass.

SP3	WEST					
F a m t	Pre-development		Post-development		Change	
Event	Flow, cfs	Volume, a-f	Flow, cfs	Volume, a-f	Flow	Volume
2-yr	0.00	0.000	0.01	0.001	0.01	0.001

3.0 CONSTRUCTION ACTIVITIES

Construction activities will involve site preparation and earthwork necessary for construction of the proposed project. These activities primarily include the following:

- Erosion control installation
- Clearing and grubbing of existing vegetation within the proposed limits of work
- Excavation stockpiling, and hauling of excavated topsoil, and subsoils
- Rough grading of all disturbed areas
- Construction of new housing units
- Construction of stormwater management system
- Installation of utilities
- Paving
- Finish grading, final site stabilization and landscaping

Erosion and sediment control (ESC) measures will be installed per the construction plans and specifications prior to commencement of any soil disturbing activities. ESC measures will remain in place until final site stabilization is complete. Topsoil will be separated from the remaining soil and stockpiled on-site for use during site finish grading. The stockpiled topsoil will be protected to prevent erosion and sedimentation. Refer to **Section 5.0 – Construction Phase Pollutant Controls** for more detailed guidelines to be followed during construction.

4.0 ANALYSIS OF MASSACHUSETTS STORMWATER STANDARDS

The Massachusetts Stormwater Standards were revised in February 2008 to include ten stormwater management standards, established jointly by the DEP and the Office of Coastal Zone Management, and published in the 2008 update of the Stormwater Management Handbook. Projects that are within the jurisdiction of the Wetlands Protection Act Regulations, 310 CMR 10.00 are subjected to these Stormwater Management Standards. For this Project, adherence to the Handbook is not required as the Project is not within the jurisdiction of the Wetlands Protection Act.

The Massachusetts Stormwater Handbook, Volume 1 Chapter 1, provides ten Stormwater Management Standards, which have been reproduced below. The stormwater management systems proposed for this project were designed to comply with these standards to the maximum extent practicable.

Standard 1: No new stormwater conveyances (e.g. outfalls) may discharge untreated stormwater directly to or cause erosion in wetlands or waters of the Commonwealth.

No new untreated stormwater will discharge to wetland areas. The proposed GSI practices and underground recharge chambers have been sized to exceed the water quality volume (WQV) storage requirements. Stormwater runoff will flow through the GSI practices before being infiltrated or reaching the site's study points.

Standard 2: Stormwater management systems shall be designed so that the postdevelopment peak discharge rates do not exceed pre-development peak discharge rates.

Discharge rates for pre- and post-development were calculated using HydroCAD® 2010, a SCS-TR20 based stormwater modeling computer program (Appendix D).

The existing site is 99% wooded, therefore any landcover changes (i.e., woods to grass) result in an increase in runoff. Post-development peak discharge rates increase up 0.4 cfs above predevelopment rates for the 2-, 10-, 25-year storms for SP1-4. SP 5 remains undisturbed and the pre- and post-development flow rates are equal.

The peak discharge rates for the 100-year storm increase, but HW has assessed the flooding and erosion potential of these events and provided low velocity outlets and distributed runoff discharge locations to address these issues. A summary table of these precipitation events is provided **Table 4**.

Standard 3: Loss of annual recharge to groundwater shall be eliminated or minimized through the use of infiltration measures including environmentally sensitive site design, low impact development techniques, stormwater best management practices, and good operation and maintenance. At a minimum, the annual recharge from the post-development site shall approximate the annual recharge from pre-development conditions based on soil type. This Standard is met when the stormwater management

system is designed to infiltrate the required recharge volume as determined in accordance with the Massachusetts Stormwater Handbook.

The proposed project was designed with low impact development techniques and green stormwater infrastructure (GSI) practices to mimic the groundwater recharge potential of the site under existing, undeveloped conditions. The majority of stormwater runoff generated is being directed to bioretention systems and underground recharge chambers to recharge groundwater as required by Standard 3. The project recharges far more than required. See **Appendix E** for recharge calculations.

Standard 4: Stormwater management systems shall be designed to remove 80% of the average annual post-construction load of Total Suspended Solids (TSS). This Standard is met when:

- Suitable practices for source control and pollution prevention are identified in a long-term pollution prevention plan, and thereafter are implemented and maintained;
- Structural stormwater best management practices are sized to capture the required water quality volume determined in accordance with the Massachusetts Stormwater Handbook; and
- Pretreatment is provided in accordance with the Massachusetts Stormwater Handbook

For infiltration of stormwater runoff from land uses with higher potential pollutant loads, discharges to the ground within an area with a rapid infiltration rate (greater than 2.4 inches per hour), a Zone II or Interim Wellhead Protection Area, and discharges to the ground near any of the following critical areas: Special Resource Waters, Outstanding Resource Waters, bathing beaches, shellfish growing areas, or cold-water fisheries, at least 44% of the total suspended solids must be removed prior to discharge to the infiltration structure.

The stormwater management pretreatment and treatment systems for the sites have been selected and sized for the most removal of the average annual load of TSS possible. These removal rates were obtained from the MA Stormwater Handbook and based on the use of a pretreatment practice for each GSI (sediment forebay or Rain Guardian Fortress units).

Sediment Forebay or

Rain Guardian Fortress: Recommended design rate: 25%

Bioretention: Recommended design rate: 90% for 1" WQV

Assumed design rate: 50% (min.) for ½" WQV

Underground Rechargers: Recommended design rate: 80%

Contech Stormceptor 450i: Recommended design rate: 80% (min.)

As the entirety of the site is a rapid infiltration area, and most of the site is a Zone II area, all practices have been designed to remove greater than 44% TSS via a combination of a

pretreatment device (Sediment Forebay or Rain Guardian Fortress) and a bioretention area sized to capture at least the ½-inch WQV.

TSS calculations are provided in **Appendix F.** The proposed Operation and Maintenance Plan was developed to ensure that the stormwater system continues to function as it was designed into the future.

Standard 5: For land uses with higher potential pollutant loads, source control and pollution prevention shall be implemented in accordance with the Massachusetts Stormwater Handbook to eliminate or reduce the discharge of stormwater runoff from such land uses to the maximum extent practicable.

Not applicable.

Standard 6: Stormwater discharges within the Zone II or Interim Wellhead Protection Area of a public water supply, and stormwater discharges near or to any other critical area, require the use of the specific source control and pollution prevention measures and the specific structural stormwater best management practices determined by the Department to be suitable for managing discharges to such areas, as provided in the Massachusetts Stormwater Handbook.

A majority of the project site is located within a Zone II Wellhead Protection Area, and the design incorporates a variety of approved source control and pollution prevention measures to ensure that all stormwater is properly treated prior to infiltration. See Standard 3 for more information on TSS removal.

Standard 7: A redevelopment project is required to meet the following Stormwater Management Standards only to the maximum extent practicable: Standard 2, Standard 3, and the pretreatment and structural best management practice requirements of Standards 4, 5, and 6.

Not applicable.

Standard 8: A plan to control construction-related impacts including erosion, sedimentation and other pollutant sources during construction and land disturbance activities (construction period erosion, sedimentation, and pollution prevention plan) shall be developed and implemented.

An Erosion and Sediment Control Plan is included in the design plans, and a Construction Phase Pollutant Prevention Plan is included in this Report. Silt fence and/or silt socks are proposed at the limit of work; silt socks are proposed along the downgradient edges of the area of disturbance. Disturbed areas will be stabilized with seeding and/or erosion control blankets, if necessary, as soon as possible to minimize erosion and sedimentation. A Stormwater Pollution Plan (SWPPP) is required as part of the NPDES Construction General Permit and will be submitted prior to construction.

The contractor will be required to establish erosion controls prior to beginning any other project-related work. The Erosion and Sediment Control Plan will also establish the limit of work, beyond which the contractor will not be allowed to perform any project work. It is the contractor's responsibility to monitor and correct erosion control practices throughout the duration of the project. Erosion control measures will not be removed until the project reaches completion as directed by the project engineer or landscape architect.

Standard 9: A Long-Term Operation and Maintenance Plan shall be developed and implemented to ensure that stormwater management systems function as designed.

An Operation and Maintenance Plan (O&M) is provided with specific needs for each best management practice. See **Appendix H**.

Standard 10: All illicit discharges to the stormwater management system are prohibited.

There will be no illicit discharges to the proposed system. The Long-Term Pollution Prevention Plan provided includes measures to prevent illicit discharges.

5.0 CONSTRUCTION PHASE POLLUTION PREVENTION PLAN

A phased approach will be used to reduce erosion and increase sediment control during the construction period. Perimeter controls and sediment settling devices will be installed during construction to minimize sediment movement in stormwater and to protect the adjacent property.

5.1 Structural Practices

The following are the structural practices that will be implemented as part of the construction activity.

- <u>Silt Fence & Sediment Silt Sock Barrier</u> will be installed prior to commencement of
 construction. This type of practice creates erosion control barriers to intercept sediment
 in diffuse runoff. The Town will be informed upon installation so that it may inspect these
 barriers prior to construction. Portions of the erosion control barriers will be replaced
 and/or repaired as necessary to prevent erosion. Barriers will be installed parallel to land
 slope at the perimeter of the work site. In addition, silt fence barriers will be installed
 around the bioretention areas during construction.
- <u>Silt Sacks (or approved equivalent)</u> will be installed at identified existing catch basins
 and structure following construction of the proposed catch basins to prevent
 sedimentation during the any additional construction. The Silt Sack will be replaced and
 disposed of off-site if damage is observed.
- Stormwater Management areas will be graded to within one foot of design elevations until the site is fully stabilized to capture sediment during construction. Heavy equipment will not be allowed to operate on the surface location where the systems are planned because soil compaction would adversely impact their long-term performance. Silt fence will be utilized around the perimeter of the bioretention systems during construction. Light earth-moving equipment will be used for excavation and construction of the systems. All excavated materials from the area will be removed and disposed of in an approved location. All bioretention areas will be inspected at least once every seven calendar days and immediately after storm events by the Site Superintendent.
- Slope Stabilization will be installed immediately upon obtaining final grades as shown on the project site plans. Areas that fail to stabilize will be re-graded to final grade and stabilized, as necessary. Amount of land disturbed will be minimized to reduce potential for erosion and sedimentation. Stabilization measures shall be initiated within 14 days following the end of construction at each portion of the site and as soon as practicable.

The entire stormwater management system will be inspected upon completion of construction. Sediment will be removed from all elements of the stormwater management system. All control measures must be installed and maintained in accordance with manufacturer's specifications, good engineering practices, and in accordance with this report (every seven-calendar days and

after storm events). If inspections show that a control has failed or been installed incorrectly, the Contractor must replace or modify it within 24 hours.

5.2 Stabilization Practices

The amount of land disturbed during construction will be minimized to reduce the potential for erosion and sedimentation. Prompt surface stabilization will be practiced thereby controlling erosion in areas where disturbances cannot be avoided during construction. Stabilization measures will be initiated within 14 days following the end of construction at each portion of the site. Exceptions to this requirement will be allowed allowable when snow cover prevents the initiation of stabilization within 14 days, in which case such measures shall be undertaken as soon as possible.

Stabilization measures that may be used during construction are described below:

- <u>Temporary Seeding</u> Temporary seeding of disturbed surfaces with fast-growing grasses (annual rye) to provide greater resistance to stormwater runoff and/or wind erosion for areas where construction has temporarily ceased.
- <u>Permanent Seeding</u> Permanent seeding of surfaces with vegetation, including but not limited to grass, trees, bushes, and shrubs, to stabilize the soil. Establishing a permanent and sustainable ground cover at a site stabilizes the soil while reducing the sediment content in runoff.
- <u>Permanent Planting</u> the contractor shall install and adequately establish all planting as required at the completion of the project.
- <u>Mulching/Hydro mulching</u> hydro mulch will be placed on the soil surface to cover and hold in place disturbed soils.

Temporary seeding or other soil stabilization measures will be provided where construction activities have ceased at the site. Topsoil stockpiles will be temporarily seeded or covered to prevent erosion and will be surrounded with silt fence. When the site's final grade has been established, permanent vegetation will be planted on the disturbed areas. The vegetation will consist of grass, shrubs, bushes, and trees.

5.3 Other Types of Controls

Additional controls/practices will be undertaken to reduce pollution in stormwater runoff flows which include, but are not limited to, control of off-site mud tracking from construction site, dust suppression, proper sanitary waste disposal, earthwork procedures timed and conducted in manners aimed to minimize erosion and sedimentation, snow removal plans, proper management of waste materials, proper management of hazardous waste, proper material stockpiling, and spill prevention and control measures.

 <u>Dust Suppression</u> – Water sprays shall be used to control dust during extended dry periods during construction.

- <u>Sanitary Wastes</u> All sanitary wastes will be collected from the portable units by a licensed sanitary waste management contractor (as required by local regulations).
- <u>Earthwork</u> The exposure of disturbed surfaces to stormwater and potential stormwater erosion will be minimized by well-organized earthwork procedures. Stabilization procedures shall be undertaken in accordance with this report. Grubbing during wet seasons will be avoided if feasible.
- Snow Removal Plan Plowed snow collected from the parking areas will be deposited
 onto free draining, pervious surfaces, away from the site's drainage conveyance
 structures to maximize infiltration. Snowmelt runoff that is not infiltrated will be directed
 to the site's stormwater management system. Snow is not to be plowed or piled onto the
 stormwater management facilities.
- Waste Materials Dumpsters rented from a licensed solid waste management company will be used to store solid waste and debris that cannot be recycled, reused, or salvaged. The dumpsters will meet all local and state solid waste management regulations. Dumpsters will be covered when refuse is not being directly deposited or withdrawn from them. Potentially hazardous wastes will be separated from normal wastes, including segregation of storage areas and proper labeling of containers. Removal of all waste from the site will be performed by licensed contractors in accordance with applicable regulatory requirements and disposed of at either local or regional approved facilities. Waste materials will not be buried on-site. All site personnel will be instructed regarding the correct procedures for waste disposal. Notices stating these procedures will be posted at the site. Solvents and flushing materials used during construction and preoperational cleaning will be provided, handled, managed, and removed by the contractor for appropriate off-site disposal.
- <u>Hazardous Waste Materials</u> Any disposal of hazardous materials will be completed using the required paperwork. Copies will be provided to the Engineer and to the Town.
- <u>Spill Prevention and Control Measures</u> To minimize the risk of spills or other accidental exposure of materials and substances to stormwater runoff, the following material management practices will be used throughout the project:
 - An effort will be made to store only enough products required to do the job.
 - All materials stored on-site will be stored in a neat, orderly manner in their appropriate containers and, if possible, under a roof or other enclosure.
 - Products will be kept in their original containers with the original manufacturer's label.
 - Substances will not be mixed with one another unless recommended by the manufacturer
 - Whenever possible, the maximum amount of a product will be used before disposing of the container.
 - Manufacturers' recommendations for proper use and disposal will be followed.

 The site superintendent will conduct daily inspections to ensure proper use and disposal of materials.

To reduce the risk associated with hazardous materials used on the site, the following practices will be used:

- Products will be kept in original containers unless they are not resealable.
- Original labels and material safety data sheets will be retained and kept on-site;
 they contain important product information.
- If surplus product must be disposed of, manufacturers' or local and state recommended methods for proper disposal will be followed.
- <u>Materials List</u> Materials or substances listed below are expected to be present on-site during construction:

- Concrete - Fertilizers

- Asphalt - Petroleum Based Products

- Paints (enamel and latex) - Cleaning Solvents

- Metal Studs- Wood- Concrete- Tar

- Sealants - Adhesives

The following product-specific practices will be followed on-site:

- <u>Petroleum Products</u> All on-site vehicles will be monitored for leaks and receive preventative maintenance to reduce the chance of leakage. Petroleum products will be stored in tightly sealed containers which area clearly labeled. Any asphalt substances used on-site will be applied according to the manufacturers' recommendations.
- <u>Fertilizers</u> Fertilizers used will be applied only in the minimum amounts recommended by the manufacturer. Once applied, fertilizer will be worked into the soil to limit exposure to stormwater. Products will be stored in a covered shed. The contents of any partially used bags of fertilizer will be transferred to a sealable plastic bin to avoid spills.
- <u>Paints</u> All containers will be tightly sealed and stored indoors when not required for
 use. Excess paint will not be discharged to the storm sewer system but will be properly
 disposed of according to the manufacturers' instructions or state and local regulations.
- <u>Concrete Trucks</u> Concrete trucks will not be allowed to wash out or discharge surplus concrete or drum wash water on the site.

In addition to the good housekeeping and material management practices discussed in the previous sections of this plan, the following practices will be followed for spill prevention and cleanup:

- Manufacturers' recommended methods for spill cleanup will be clearly posted, and site
 personnel will be made aware of the procedures and location of the information and
 cleanup supplies.
- Materials and equipment necessary for spill cleanup will be kept in the material storage area on-site. Equipment and materials will include, but not be limited to, brooms, dustpans, mops, rags, gloves, goggles, speedi-dry, sand, sawdust, and plastic and metal trash containers specifically for this purpose.
- All spills will be cleaned up immediately after discovery. Spills large enough to reach the storm water system will be reported to the National Response Center at 1-800-424-8802.
- The spill area will be kept well ventilated, and personnel will wear appropriate protective clothing to prevent injury from contact with a hazardous substance.
- Spills of toxic or hazardous material will be reported to the appropriate state or local government agency, regardless of the size.
- The site superintendent responsible for the day-to-day site operations will be the spill prevention and clean-up coordinator. He will designate at least three other site personnel who will receive spill prevention and cleanup training. These individuals will each become responsible for a particular phase of prevention and cleanup. The names of responsible spill personnel will be posted in the material storage area and in the on-site office trailer.

6.0 STORMWATER OPERATION AND MAINTENANCE PLAN

All stormwater management measures and controls identified in this Drainage Report shall be operated and maintained appropriately during the construction phase of the project and during regular operation of the site in the post-construction period as required on the construction drawings and a separate Stormwater Management Maintenance Plan (Appendix H).

APPENDIX A

NRCS Soils Report Site Soil Evaluations

Natural

Natural Resources Conservation Service A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for Dukes County, Massachusetts

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2 053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

Custom Soil Resource Report

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

Custom Soil Resource Report

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20.000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Dukes County, Massachusetts Survey Area Data: Version 18, Sep 2, 2021

Soil map units are labeled (as space allows) for map scales 1:50.000 or larger.

Date(s) aerial images were photographed: Dec 31, 2009—Nov 5, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend (Southern Tier Soils Report)

Map Unit Descriptions (Southern Tier Soils Report)

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not

mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An association is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Dukes County, Massachusetts

259B—Carver loamy coarse sand, 3 to 8 percent slopes

Map Unit Setting

National map unit symbol: 2y07t

Elevation: 0 to 240 feet

Mean annual precipitation: 36 to 71 inches
Mean annual air temperature: 39 to 55 degrees F

Frost-free period: 140 to 240 days

Farmland classification: Not prime farmland

Map Unit Composition

Carver, loamy coarse sand, and similar soils: 80 percent

Minor components: 20 percent

Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Carver, Loamy Coarse Sand

Setting

Landform: Moraines, outwash plains

Landform position (two-dimensional): Summit, shoulder, backslope, footslope,

toeslope

Landform position (three-dimensional): Head slope, nose slope, side slope, crest,

tread

Down-slope shape: Convex, linear

Across-slope shape: Linear

Parent material: Sandy glaciofluvial deposits

Typical profile

Oi - 0 to 2 inches: slightly decomposed plant material Oe - 2 to 3 inches: moderately decomposed plant material

A - 3 to 7 inches: loamy coarse sand E - 7 to 10 inches: coarse sand Bw1 - 10 to 15 inches: coarse sand Bw2 - 15 to 28 inches: coarse sand BC - 28 to 32 inches: coarse sand C - 32 to 67 inches: coarse sand

Properties and qualities

Slope: 3 to 8 percent

Depth to restrictive feature: More than 80 inches

Drainage class: Excessively drained

Runoff class: Low

Capacity of the most limiting layer to transmit water (Ksat): Moderately high to very

high (1.42 to 14.17 in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None Frequency of ponding: None

Maximum salinity: Nonsaline (0.0 to 1.9 mmhos/cm)

Available water supply, 0 to 60 inches: Low (about 4.5 inches)

Interpretive groups

September 28, 2020

Oak Bluffs Resident Homesite Committee PO Box 1941 Oak Bluffs, MA 02557

Re: Soiltesting-Oak Bluffs Assessor Parcel 50-31-Edgartown-Vineyard Haven Road

Dear Mr. Crossland:

On September 28, 2020, Schofield, Barbini, and Hoehn, Inc. performed a soils investigation at the above referenced property. Four deep observation holes were excavated by backhoe and the following soil conditions were found:

Test Hole 1: 0"-5" Loamy f-m SAND (topsoil)
5"-29" Sandy LOAM with Gravel to Stones
29"-68" (subsoil) Sandy LOAM to Silt LOAM
68"-128" (unsuitable) Loamy SAND with Gravel

Groundwater was not encountered at a depth of 128". A design percolation rate of two minutes per inch was determined for the material below 68".

Test Hole 2: 0"-5" Loamy f-m SAND (topsoil)
5"-26" Sandy LOAM with Gravel (subsoil)

26"-58" Sandy LOAM to Silt LOAM 58"-132" (unsuitable) SAND with Gravel

Groundwater was not encountered at a depth of 132". A design percolation rate of two minutes per inch was determined for the material below 58".

MV 12130 Page 2

Test Hole 3: 0"-5" Loamy f-m SAND (topsoil)
5"-33" Sandy LOAM (subsoil)
33"-132" SAND with Gravel to Cobbles

Groundwater was not encountered at a depth of 132". A design percolation rate of two minutes per inch was determined for the material below 33".

Test Hole 2: 0"-5" Loamy f-m SAND (topsoil)
5"-27" Sandy LOAM with Gravel (subsoil)
27"-72" Sandy LOAM to Silt LOAM (unsuitable)
72"-138" SAND with Gravel

Groundwater was not encountered at a depth of 138". A design percolation rate of five minutes per inch was determined for the material below 72".

This investigation was witnessed by Megan Lancaster, agent for the Oak Bluffs Board of Health.

Based on this investigation and experience in the area, it is our opinion that the soils encountered are suitable for the construction of a waste water disposal facility on this property. If a disposal facility is design and constructed based on the soils found in Test Holes 1, 2, and 4, it is imperative that the design engineer inspect excavation of the facility at time of construction to insure that it is constructed below unsuitable materials or other appropriate measures are taken.

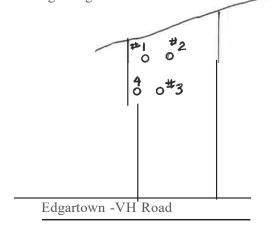

As plans for the property develop, additional soil testing may be warranted in order to allow for the most efficient system design.

Please feel free to contact me if you have any questions regarding this matter.

Sincerely,

Original Signed

Re: Additional soil testing

Oak Bluffs Assessor Parcel 50-31 - Edgartown-Vineyard Haven Road

Dear Mr. Crossland:

To augment the soils investigation of September 2020 performed at the northwest corner of locus, on August 27, 2021, Schofield, Barbini, and Hoehn, Inc. performed additional soils investigations at the southeast corner of the above referenced property, outside of the Farm Neck Well Zone II. Four deep observation holes were excavated by backhoe and the following soil conditions were found:

Test Hole 5: 0"-4" Loamy SAND (topsoil)

4"-27" Loamy fine to medium SAND (subsoil)

27"-66" Fine Sandy LOAM to Silt LOAM (unsuitable)

66"-126" Medium to coarse SAND

Groundwater was not encountered at a depth of 126". A design percolation rate of five minutes per inch was determined for the material below 66".

Test Hole 6: 0"-4" Loamy SAND (topsoil)

4"-25" Loamy fine to medium SAND (subsoil)

25"-54" Sandy LOAM to Silt LOAM (unsuitable)

54"-120" Medium to coarse SAND

Groundwater was not encountered at a depth of 120". A design percolation rate of five minutes per inch was determined for the material below 54".

MV 12130 Page 2

Test Hole 7: 0"-4" Loamy SAND (topsoil)

4"-26" Loamy fine to medium SAND (subsoil)

26"-60" Fine Sandy LOAM to Silt LOAM (unsuitable)

60"-120" Medium to coarse SAND

Groundwater was not encountered at a depth of 120". A design percolation rate of two minutes per inch was determined for the material below 60".

Test Hole 8: 0"-4" Loamy SAND (topsoil)

4"-30" Loamy fine to medium SAND (subsoil)

30"-120" Medium SAND

Groundwater was not encountered at a depth of 120". A design percolation rate of five minutes per inch was determined for the material below 30".

This investigation was witnessed by Garrett Albiston, agent for the Oak Bluffs Board of Health.

Based on this investigation and experience in the area, it is our opinion that the soils encountered are suitable for the construction of a waste water disposal facility on this property. If a disposal facility is design and constructed based on the soils found in Test Holes 5, 6, and 7, it is imperative that the design engineer inspect excavation of the facility at time of construction to insure that it is constructed below unsuitable materials or other appropriate measures are taken.

As plans for the property develop, additional soil testing may be warranted in order to allow for the most efficient system design.

Please feel free to contact me if you have any questions regarding this matter.

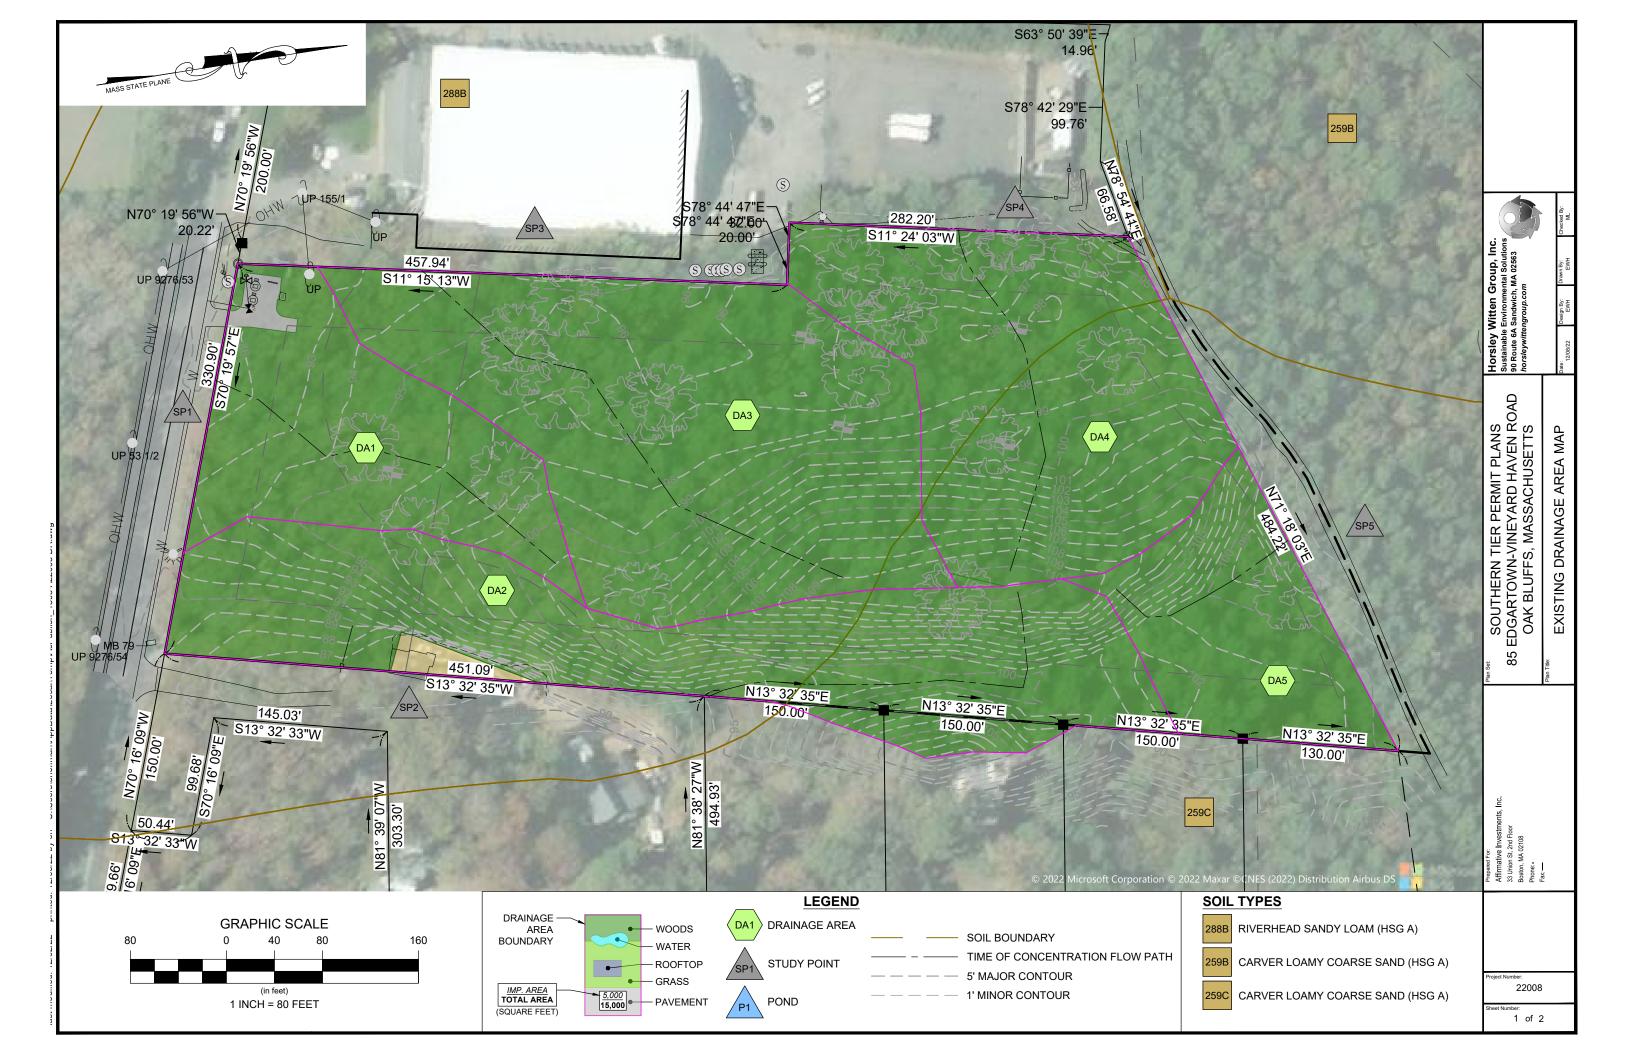

Sincerely,

Christopher P. Alley

STANDARD 3-RECHARGE REQUIREMENTS

Project Name: Tackenash Knoll

Project No: 22008

Calculated by: KF

Checked: EWH

Date: 12/2/2022

TOTAL DRAINAGE AREA	331,840	sf
	7.62	acres
TOTAL IMPERVIOUS AREA	94,020	sf
	2.16	acres
TOTAL IMPERVIOUS TO RECHARGE	90,440	sf
	2.08	acres
% IMPERVIOUS TO BE RECHARGED	96.2	%

SOIL TYPE	Α	
RECHARGE VOLUME REQUIRED (Rv)	4,530	cft
INFILTRATION RATE	8.27	in/hr
BOTTOM SURFACE AREA OF CHAMBERS	6,700	sf
ESTIMATED DRAWDOWN TIME FOR Rv*	0.98	hr
*Must be less than 72 HRS		

RECHARGE VOLUMES		
RAINFALL	1	in
URC-1 VOLUME	5900	cf
URC-2 VOLUME	1400	cf
URC-3 VOLUME	7600	cf
URC-4 VOLUME	6000	cf
TOTAL RECHARGE VOLUME PROVIDED	20900	cf
TOTAL RECHARGE VOLUME REQUIRED	4530	cf

Calculate Required Recharge Volume. The Required Recharge Volume equals a depth of runoff corresponding to the soil type times the impervious areas covering that soil type at the post-development site.

> Rv = F x impervious area Equation (1)

 $\begin{array}{ll} Rv & = \textit{Required Recharge Volume}, \text{ expressed in Ft}^3, \text{ cubic yards, or acre-feet} \\ F & = \text{Target Depth Factor associated with each Hydrologic Soil Group} \\ \textit{Impervious Area} & = \text{pavement and rooftop area on site} \\ \bigcirc_{S} \\ \end{array}$

To determine whether an infiltration BMP will drain within 72 hours, the following formula must be used²¹:

 $R\nu$

 $Time_{drawdown} = \frac{K}{(K)(Bottom \ Area)}$

 $Rv = Storage\ Volume$ $K = Saturated\ Hydraulic\ Conductivity\ For\ "Static"\ and\ "Simple\ Dynamic"\ Methods,\ use$ $Rawls\ Rate\ (see\ Table\ 2.3.3).\ For\ "Dynamic\ Field"\ Method,\ use\ 50\%\ of\ the\ in-situ\ saturated$ hydraulic conductivity.

 $Bottom\ Area=Bottom\ Area\ of\ Recharge\ Structure^{22}$

th

Rawls Table

Nawis Table					
Texture Class	NRCS Hydrologic Soil	Infiltration Rate			
	Group (HSG)	Inches/Hour			
Sand	Α	8.27			
Loamy Sand	Α	2.41			
Sandy Loam	В	1.02			
Loam	В	0.52			
Silt Loam	С	0.27			
Sandy Clay	С	0.17			
Clay Loam	D	0.09			
Silty Clay	D	0.06			
Sandy Clay	D	0.05			
Silty Clay	D	0.04			
Clay	D	0.02			

²⁰ The drawdown analysis also assumes that the water table does not fluctuate during the draw down period.
21 In some cases, the infiltration structure may be designed to treat the Required Water Quality Volume and/or to attenuate peak discharges in addition to infiltrating the Required Reachage Volume. In that event, the storage volume of the structure must be used in the formula for determining drawdown time in place of the Required Reacharge Volume.

Stormwater Treatment Recommendation

The recommended Stormceptor Model(s) which achieve or exceed the user defined water quality objective for each site within the project are listed in the below Sizing Summary table.

Site Name	WQU
Target TSS Removal (%)	80
TSS Removal (%) Provided	95
Recommended Stormceptor Model	STC 450i

The recommended Stormceptor Model achieves the water quality objectives based on the selected inputs, historical rainfall records and selected particle size distribution.

Stormceptor Sizing Summary				
Stormceptor Model	% TSS Removal Provided			
STC 450i	95			
STC 900	97			
STC 1200	97			
STC 1800	98			
STC 2400	98			
STC 3600	98			
STC 4800	99			
STC 6000	99			
STC 7200	99			
STC 11000	99			
STC 13000	99			
STC 16000	100

DUKES COUNTRY REGISTRY OF DEEDS

Project Description:

Construction of Planned Residential Development

NHESP File No.:

21-40189

Dear Applicant:

The Natural Heritage & Endangered Species Program of the Massachusetts Division of Fisheries & Wildlife (the "Division") received the MESA Review Checklist with the site plan entitled Planned Residential Development Southern Tier Property Oak Bluffs, Massachusetts ("Site Plan with Area Summary," 1 sheet; dated July 15, 2022, revised through October 12, 2022; prepared by Horsley Witten Group, Inc.; the "Plan") and supporting documentation for review pursuant to the MA Endangered Species Act Regulations (321 CMR 10.18).

The MESA is administered by the Division, and prohibits the Take of state-listed species. The Take of state-listed species is defined as "in reference to animals…harm…kill…disrupt the nesting, breeding, feeding or migratory activity…and in reference to plants…collect, pick, kill, transplant, cut or process…Disruption of nesting, breeding, feeding, or migratory activity may result from, but is not limited to, the modification, degradation, or destruction of Habitat" of state-listed species (321 CMR 10.02).

The Division has determined that this project, as currently proposed, will occur within the actual habitat of the Imperial Moth (*Eacles imperialis*), state-listed as "Threatened." This species and its habitats are protected in accordance with the rare species provisions of the MESA. A Fact Sheet for these species can be found on our website, www.mass.gov/nhesp.

The project, as proposed, includes the construction of a planned affordable residential housing development ("Southern Tier Property"), utilities, landscaping and associated site work resulting in ± 4.95 acres of habitat disturbance (hereinafter, the "Work"; labeled "Area A" on the Plan) on a ± 7.78 -acre parcel owned by the Oak Bluffs Resident Homesite Committee. As an integral part of the project, the Applicant has proposed to permanently protect ± 1.87 acres of the property (labeled "Protected Open Space" on the Plan) as open space and state-listed species habitat through fee transfer or donation of a conservation restriction to a qualified conservation entity.

Area A (Southern Tier Property):

Based on the information provided and the information contained in our database, the Division finds that this project, as currently proposed, <u>must be conditioned</u> in order to avoid a prohibited Take of <u>state-listed species</u> (321 CMR 10.18(2)(a)). To avoid a prohibited Take of state-listed species, the following conditions must be met:

- 1. <u>Recordation</u>: Prior to the Start of Work, the Applicant shall record this determination letter and the Plan in the Dukes County Registry of Deeds so as to become a record part of the chain of title for the property. Prior to the start of Work, the Applicant shall provide the Division with written proof of said recordation.
- 2. <u>Symbolic Fencing:</u> Prior to the start of Work, symbolic fencing shall be erected along the "Limit of Work (Phase I & II)" shown on the Plan and maintained throughout the construction period. No work or activity shall occur on the property outside the "Limit of Work (Phase I & II)" shown on the Plan.
- 3. <u>Monumentation:</u> Prior to the start of Work, the Applicant shall submit a plan to permanently monument the "Protected Open Space" shown on the Plan. Prior to the start of Work or as otherwise approved by the Division, monumentation shall be installed pursuant to the Division-approved plan. Said monumentation shall be maintained in good condition and repaired or replaced, as necessary.
- 4. <u>Compliance Report</u>: Within thirty (30) days of the completion of work or as otherwise approved by the Division, the Applicant shall submit written confirmation to the Division documenting compliance with the conditions outlined herein.
- 5. <u>Habitat Protection:</u> Within one (1) year of the start of Work and prior to recording any instrument to transfer or protect the "Protected Open Space" shown on the Plan, the Applicant shall provide the Division with a plan for permanently protecting the "Protected Open Space" as open space and state-listed species habitat pursuant to Article 97 provisions.

Provided the above-noted conditions are fully implemented and there are no changes to the Plan, this project will not result in a Take of state-listed species. This determination is a final decision of the Division of Fisheries and Wildlife pursuant to 321 CMR 10.18. Any changes to the proposed project or any additional work beyond the "Limit of Work (Phase I & II)" shown on the Plan may require an additional filing with the Division pursuant to the MESA. This project may be subject to further review if no physical work is commenced within five years from the date of issuance of this determination, or if there is a change to the project.

Area B and Future Residential Housing Project (Southern Woodland Reservation):

The Applicant and the Island Housing Trust have disclosed that, at some future time, an access road on the property (labeled "Area B" on the Plan) as well as additional affordable residential housing on land immediately north of the property presently owned by the Martha's Vineyard Land Bank ("Southern Woodland Reservation") may be proposed.

The Division notes that any future projects or activities proposed on and adjacent to the property which are (a) located outside of the approved "Limit of Work (Phase I & II)" shown on the Plan, (b) not exempt

from review pursuant to 321 CMR 10.14, and (c) located within mapped Priority Habitat as indicated in the Massachusetts Natural Heritage Atlas, will require review by the Division pursuant to MESA. Furthermore, 321 CMR 10.16 provides that projects shall not be segmented or phased to evade or defer the review requirements under MESA. If the Division determines, based on the considerations provided for in 321 CMR 10.16, that a future proposed project or activity is part of a larger common project or scheme, it may evaluate the cumulative impacts of the existing and proposed segments of the common project when reviewing the future proposed project or activity pursuant to MESA.

Please note that this determination addresses only the matter of state-listed species and their habitats. If you have any questions regarding this letter please contact Jesse Leddick, Chief of Regulatory Review, at (508) 389-6386 or jesse.leddick@mass.gov.

Sincerely,

cc:

MESA Project Review

Planned Residential Development Southern Tier Property

Oak Bluffs, Massachusetts

September 2022

September 8, 2022

Mr. Jesse Leddick Natural Heritage and End. Species Program MA Division of Fisheries and Wildlife One Rabbit Hill Road Westborough, MA 01581

Re: MESA Project Review – Planned Residential Development, "Southern Tier" Property Assessor's Map 50, Parcel 31, 85 Edgartown Vineyard Haven Road, Oak Bluffs, MA NHESP Tracking No. 21-40189

Dear Mr. Leddick:

On behalf of the Affirmative Investments Inc. (Applicant) and Island Housing Trust, and in accordance with the Massachusetts Endangered Species Act (M.G.L. Ch. 131A) or MESA, the Horsley Witten Group, Inc. (HW) is submitting the enclosed MESA Project Review along with supporting documentation for the proposed affordable housing project at the referenced parcel located off Edgartown Vineyard Haven Road in Oak Bluffs, Massachusetts.

The proposed project involves the construction of an affordable housing development on a portion of a 7.8-ac parcel of forested land. According to the most recent version of the *Massachusetts Natural Heritage Atlas* (15th Edition, August 1, 2021), the project parcel occurs in whole or in part within *Priority Habitat of Rare Species* (PH 121) as designated by the Massachusetts Natural Heritage and Endangered Species Program (NHESP); the site is mapped for the state-Threatened Imperial Moth (*Eacles imperialis*).

The proposed project has been designed to avoid and minimize impacts to this species and its habitat by limiting site disturbance, permanently protecting a portion of undisturbed habitat, and restoring areas of temporary grading with native species found at the site.

Enclosed please find a completed MESA Project Review Filing Checklist and required documentation and site plans, along with a check for \$300.00 made payable to Commonwealth of MA – NHESP, for review as a "simple" project (less than 5 acres of disturbance).

Jesse Leddick, NHESP September 8, 2022 Page 2 of 2

Thank you in advance for your review of this information. Please do not hesitate to contact me directly at (508) 833-6600 or at aball@horsleywitten.com with any questions you may have pertaining to this application.

Sincerely,

Horsley Witten Group, Inc.

MESA PROJECT REVIEW Planned Residential Development Southern Tier Property

September 2022

1.0 INTRODUCTION AND BACKGROUND

The Town of Oak Bluffs has been working to address the need for low-income housing for year-round residents for a number of years. In 2017, the Town developed a Housing Production Plan (HPP) specifically to address the need for affordable housing in Oak Bluffs with proposed strategies for meeting the housing need. A 2019 Master Plan was created with a focus on affordable housing and studying suitable project locations. The Master Plan aimed to balance the growth of the population and infrastructure on the island with the preservation of the natural environment.

The Town then received a grant from MassHousing, which resulted in the development of the *Town of Oak Bluffs Housing Feasibility Study*, which was completed by RKG Associates, Inc. and Weston and Sampson in March 2020. This feasibility study identified a 7.8-acre townowned parcel of land identified in the Master Plan as the "Southern Tier" area along Edgartown-Vineyard Haven Road as suitable for housing development. The Master Plan also discussed different development scenarios and project recommendations.

Subsequently, the Town of Oak Bluffs selected the "Southern Tier" property for development of an affordable housing project and issued a Response for Proposals (RFP) for a 60-unit affordable and workforce housing project. In accordance with local regulations, the design necessitates that all wastewater treatment and discharge will be managed onsite, until such time as the Town's wastewater treatment facility may be upgraded.

The proposed Southern Tier project is a result of the Town's planning efforts with the intent of creating a walkable community that is along the Town's bus route and within proximity to nearby recreational facilities and walking paths. The development will occur in two phases, the first phase proposes the construction of 45 units and the second phase proposes 15 units.

The project site is currently undeveloped forested land that is also partially mapped as Priority Habitat (PH 121) for the State-Threatened Species, Imperial Moth (*Eacles imperialis*). The project design aims to preserve a portion of the land as open space and minimize long-term impacts by restoring graded areas with native species compatible with the existing landscape.

2.0 GENERAL SITE DESCRIPTION

The project site is a 7.8-acre parcel owned by the Oak Bluffs Affordable Housing Trust. It is a forested parcel located at 85 Edgartown-Vineyard Haven Road in Oak Bluffs, MA (latitude 41.41955 N; longitude -70.59085 W) (**Attachment A**, Figures 1 and 2). The parcel is identified by the Oak Bluffs Assessor's database as Map 50 Parcel 31.

The western property boundary abuts the Arena and YMCA of Martha's Vineyard. To the east of the site, the property is bounded by residential properties and light industry. Edgartown

Vineyard Haven Road bounds the property to the south and is the main access road to the Site. Across the street, immediately to the south on Edgartown Vineyard Haven Road is Martha's Vineyard High School. The northern property boundary abuts undeveloped lands held by the Martha's Vineyard Land Bank Commission, known as Southern Woodlands Reservation.

Photo 1. View of mixed oak-pitch pine vegetation community at Southern Tier parcel (March 2022).

2.1 FEMA Designation

According to the current FEMA Flood Insurance Rate Map (FEMA FIRM) for Town of Oak Bluffs (Community Panel 25007C0112J, effective date 07/20/2016), the project site is mapped within Zone X: *Areas of Minimal Flood Hazard* (**Attachment A**, Figures 3 and 3A).

2.2 State-listed Rare Species Habitat

According to the most recent version of the *Massachusetts Natural Heritage Atlas* (15th Edition, August 1, 2021), the project site occurs within *Priority Habitat of Rare Species* (PH 121) as designated by the Massachusetts Natural Heritage and Endangered Species Program (NHESP) (**Attachment A**, Figure 4).

In response to a MESA Information Request (Tracking No. 21-40189), NHESP has indicated that this designation is due to the presence of the state-threatened, Imperial Moth (*Eacles imperialis*) (**Attachment B**). According to the NHESP Fact Sheet, primary habitat for this species includes pitch pine (*Pinus rigida*), and the priority habitat mapping appears to follow the

dense areas of concentrated pitch pine growth. We understand that other, unaltered habitat at the site also provides habitat for this species.

2.3 Habitat Description

On March 21, 2022, HW ecology staff performed a site visit to assess the general habitat characteristics and to identify any unique features. As noted, the Southern Tier parcel consists of undeveloped forested land with a plant composition comprised of species a canopy of pitch pine and mixed oak (*Quercus alba, Q. velutina, Q. coccinea*). The understory is dominated by black huckleberry (*Gaylussacia baccata*) with patches of sheep laurel (*Kalmia angustifolia*) and lowbush blueberry (*Vaccinium angustifolium*) interspersed with patches of wintergreen (*Gaultheria procumbens*) and trailing arbutus (*Epigaea repens*), and occasional bracken fern (*Pteridium aquilinum*). A sparse shrub layer creates an open landscape. HW observed a small amount of chokeberry (*Aronia* sp.) along the road and occasional scrub oak (*Quercus ilicifolia*); otherwise, the plant community is fairly uniform throughout the site, with variable concentrations of pitch pine and oaks (Photos 1 and 2). Snags and fallen dead trees (boles) as well as narrow wildlife paths are located throughout the site. The duff layer (fallen leaves, small branches) is approximately 4-6 inches.

Photo 2. Alternate view of mixed oak-pitch pine vegetation community.

The topography of the site rises gently from Edgartown-Vineyard Haven Road to the north and from the adjacent YMCA property to the west and is generally flat apart from a linear mound that

occupies the eastern central portion of the site (Photo 3). This mounded area slopes gently to the west and south, and slopes more steeply to the east and north of the site leveling out to the to an even plane to the north and northwest of the site where the Old Holmes Hole Road is located.

Photo 3. View of mounded landform in eastern central portion of the site where there is a concentration of pitch pine.

According to the NRCS Soil Survey and MassGIS, the soils underlying the site are classified as Riverhead sandy loam, 0 to 3 percent slopes (288A) in the southern/western portions of the site, while the northern and eastern portions consist of Carver loamy coarse sand, 8 to 15 percent slopes (259C) (**Attachment A**, Figure 5). Using a hand-held auger, HW confirmed that the soils at the site consist of well-drained spodosols that are consistent with the NRCS mapping.

There are two areas of minor existing land disturbance, one in the southwest corner where an existing sewer pump station and access road are located, and the other along the southeastern property line where there is some encroachment from the neighboring property (Photo 4).

Photo 4. Existing sewer pump station and access drive in southwestern corner of site (left) and encroachment of structures and materials along southeastern property line (right).

2.4 Other Considerations

The subject parcel is located within the MassDEP approved Zone II wellhead protection area of Farm Neck Wellfield (see **Attachment A**, Figure 4).

3.0 PROPOSED PROJECT

The project consists of a 60-unit affordable housing development, which will be constructed in two phases. The first phase proposes the construction of 45 units and the second phase (15 units) to be constructed contingent upon upgrades to the town's sewer system. Housing for Phase I will be provided in 10 buildings with an additional office/community building (11 buildings total), associated parking areas, and stormwater management. The access road from Edgartown-Vineyard Haven Road will enter the site in the southeastern corner, then curve toward the central portion of the site, avoiding the mounded landform. Parking and access drives will be located behind the buildings to create a walkable community. In addition to the housing, the design incorporates a central common green space with interior pedestrian pathways and connections to walking trails. A woodland walking trail is proposed to connect to Old Holmes Hole Road, an ancient way (Photo 5).

The concept design is shown on the attached plan prepared by Horsley Witten Group, Inc. (HW) (**Attachment C**).

Photo 5. View of Old Holmes Hole Road located north of the Southern Tier project site.

The project layout concentrates development to the southern and western portions of the site, occupying 212,112 SF (4.87 acres) for the full buildout (both Phases I and II) and allowing for preservation of a portion of the existing habitat 81,590 SF (1.87 ac) of the existing forested habitat as protected open space (Table 1) This land is contiguous with abutting conservation lands (Southern Woodland Reservation). Proposed landscaping will focus on native species supplemented with ornamental landscape plantings and where feasible, temporary grading along roads adjacent to undisturbed forested habitat will be revegetated with similar species, including pitch pine and huckleberry to preserve the long-term habitat surrounding the proposed housing development.

Table 1. Summary of Imperial Moth Habitat Disturbance and Anticipated Mitigation

	Land Area						
	(SF)	(ac)					
Total Land (Map 50, Parcel 31)	337,913	7.78					
Total Mapped Imperial Moth Habitat	167,024	3.84					
Area of Habitat Disturbance (Phases I &2)	215,197	4.87					
	1						
Mitigation Available							
Habitat Preservation	81,590	1.87					

The first phase of the project (45-units) will be serviced with an on-site enhanced innovative/alternative (IA) nitrogen reducing wastewater system (KleanTu®); the system and reserve leach fields are concentrated outside of the Zone II. The project will be on Town water. As noted, construction of the second phase will be predicated on future upgrades to the Towns sewer treatment system, which are not anticipated to occur in the near future (approximately 5-10 years or more). In accordance with the Town RFP, the overall project design also includes potential future development of an access road leading to lands to the north of this site where the Town's 2017 Housing Production Plan and 2019 Master Plan identify the potential for additional housing development. As discussed with NHESP during a meeting on July 19, 2022, this potential future project to the north is separate from the currently proposed Southern Tier plan and this future development is also predicated on long-term upgrades to the Town's wastewater treatment system. The approximate location of this future road is shown along the eastern property line in **Attachment C**.

4.0 HABITAT IMPACTS AND ANTICIPATED MITIGATION

Most of the site is a pitch pine-oak woodland which is a characteristic habitat for the Imperial Moth, and the larvae of this species feeds exclusively on pitch pine trees which is a dominant species at the site, particularly in the central portion and along the mounded landform as seen in the aerial image (see **Attachment A**, Figure 2).

The proposed development will result in a loss of this vegetation and habitat for this State-threatened Imperial Moth. Through discussions with NHESP, the project design has been modified from an earlier iteration where habitat impacts were accounted for only within mapped habitat areas. The modified project plans avoid and minimize impacts to the greatest extent practicable within both mapped habitat and within adjacent interstitial habitat by maintaining total site disturbance of currently unaltered forested habitat to less than five acres and clustering the development to reduce habitat fragmentation. It is anticipated that the project will not result in a regulatory Take of this species with the current design.

The proposed project also provides mitigation measures including habitat preservation of 1.87 acres of the existing pitch pine-oak forest as conservation land to maintain connectivity with the Southern Woodland Reservation, which is also mapped Priority Habitat, as well as incorporating native plantings within the landscape design and restoration plantings to the extent practicable along graded slopes adjacent to undisturbed areas.

Formal preservation of this woodland will maintain connectivity to the Southern Woodlands Reservation and adjacent parcels which are also classified as priority habitat for the Imperial Moth. Placement of this portion of woodland under permanent habitat protection will allow additional protection of an area of contiguous wildlife habitat for a variety of species, including the Imperial Moth, and will further the interests of habitat protection and contribute to the protection of Imperial Moth habitat.

5.0 SUMMARY

The project site consists of approximately 7.8 acres of undeveloped forested land that is fairly uniform in its habitat composition with concentrations of pitch pin in the central and northern sections. The undeveloped forested land provides suitable habitat for the state-listed

Threatened Species, the Imperial Moth. It is anticipated that the proposed housing development project will not result in a regulatory Take of this species, as the disturbance is less than 5 acres. As mitigation for impacting 4.87 acres of priority habitat, the project proponents are looking to preserve 1.87 of the forested woodland in the north/northeast of the site as formal protected open space that will also maintain connectivity to Southern Woodland Reservation and adjacent properties which serve as priority habitat for the Imperial Moth.

Massachusetts Division of Fisheries & Wildlife

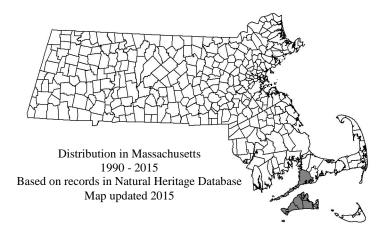

Imperial Moth Eacles imperialis

State Status: **Threatened** Federal Status: **None**

DESCRIPTION: The Imperial Moth (*Eacles imperialis*) is a large, colorful saturniid moth. The male has a forewing length of 47-59 mm, while the female is even larger, with a forewing length of 58-68 mm (Tuskes et al. 1996). Both the forewing and the hind wing are bright vellow, with purplish to reddish-brown postmedial lines and a variable amount of shading of the same color. As compared to the female, the male often has more shading at the outer wing margins and in the basal area of the wings. Both sexes have a variable amount of dark brown to black speckling on both the forewing and hind wing. Also, both sexes have round, purplish to reddish-brown reniform and subreniform spots on the forewing, the center of each spot filled with gray; as well as a similar discal spot on the hind wing. The head, thorax, and abdomen are the same bright yellow as the wings, with purplish to reddish-brown patches on the thorax and transverse bands on the abdomen.

HABITAT: In Massachusetts, the Imperial Moth inhabits pitch pine-scrub oak barrens, pitch pine woodland, and pitch pine-oak woodland.

LIFE HISTORY: In Massachusetts, adult Imperial Moths emerge in late June and July, with peak emergence

Eacles imperialis, female • From MA: Dukes Co., West Tisbury, adult female collected 18 Jul 2003 by P.Z. Goldstein, L. Raleigh, and T. Simmons, reared from egg, adult emerged 3 Aug 2004

Adult Flight Period in Massachusetts

	Jan		Feb		Mar		Apr		May		Jun		Jul		Aug		Sep		Oct		Nov		Dec	
I																								

in late July; the flight period ends in early August (Goldstein 2010). Larvae feed almost exclusively on pitch pine (*Pinus rigida*) (Goldstein 2010), although there have been occasional reports of late instar larvae on oaks (*Quercus*). Larvae are fully grown by September, at which time they burrow into the soil and pupate. The pupa overwinters.

GEOGRAPHIC RANGE: The Imperial Moth is widely distributed in eastern North America, from Massachusetts south to Florida, and west to Nebraska and Texas (Tuskes et al. 1996). It has declined dramatically in New England during the past 100 years, with the only surviving population in the region now restricted to Martha's Vineyard, Massachusetts (Goldstein 2010). Occasionally, individuals that presumably originated from Martha's Vineyard are found on the Elizabeth Islands or the nearby mainland.

A Species of Greatest Conservation Need in the Massachusetts State Wildlife Action Plan

Massachusetts Division of Fisheries & Wildlife

Please allow the Natural Heritage & Endangered Species Program to continue to conserve the biodiversity of Massachusetts with a contribution for 'endangered wildlife conservation' on your state income tax form, as these donations comprise a significant portion of our operating budget.

www.mass.gov/nhesp

STATUS AND THREATS: The Imperial Moth is threatened by habitat loss and fire suppression. Other potential threats include introduced generalist parasitoids, aerial insecticide spraying, clear-cut timber harvest, and light pollution.
