Mr. Paul Foley, MVC DRI Coordinator
Lucy Morrison, Exec. Assistant
foley@mvcommission.org AND morrison@mvcommission.org

Dear Mr. Foley AND Ms. Morrison,
I am formerly from Buzzards Bay, MA. Two years ago, I had to sell my treasured (year-round) home on Buttermilk Bay due to the impacts of the Future Generation Wind Industrial Power Plant (located in Plymouth, MA). The nearest of the four towers of the FGW power plant, was located 2100 feet from my home. Impacts on my health, peaceable living (indoors or out), sleep, sanity, and my pets wellbeing, etc. forced me from a home I had remodel just one year prior... it was to be my home in retirement.

I beg you and your colleagues to do serious diligence with this project that is being proposed Vineyard Wind Connector. Frankly, I am astonished that 'we' keep going down this road of industrial wind. It is unfortunate that the truths of WIND are not release to the general population, as they ought to be. There is countless evidence that wind does not generate anywhere near the power that it costs. This is only a money making scheme for opportunists gobbling up taxpayer monies that serve to bolster this bogus 'business'. Hard to believe that the people we put in power to protect us, our communities, our wildlife, and environs, do not reach out to those of us that have firsthand knowledge of this sham, or do the slightest bit of research. Is everyone being lulled by the magicians swaying timepiece? (PAYOLA) Wind power benefits are a fantastic pipedream touted by those that have been spoon fed by climate alarmists. Wind power is not free and certainly not cheap and any country that is employing wind can quantify that. Let us not forget about the citizens of those regions, that have become 'energy POOR'.

We pay our ever-increasing exorbitant electric bill without even being aware of the hidden costs resulting from government subsidies used to fund these huge swindles, and the ongoing shut-down of oil, coal power, and nuclear plants. Now, with great delusion, we are adding to the hopeless intermittency of wind power.

Let's imagine, a bunch of multi-million dollar mechanics in the midst of the ocean... in short order they will all break-down and spew 100's of gallons of oil (as is a fact of land-based IWT's). Offshore turbines will 'boast' a shorter life expectancy that those on land - which is not more than 10 crippled years.

As I know from personal experience noise and infrasound travel even greater distances over water, not to mention the adverse effects on fish/ocean organisms.

Please refrain from following the renewable wave of greed.

Sincerely,
Cayce Sands

(Formerly of Head of the Bay Rd. Buzzards Bay)
